**Introduction**

Most foods harbor microorganisms in different concentrations. *Salmonella* species are one of the major causes of foodborne illness worldwide. There are over 1500 *Salmonella* serotypes (species). Many serotypes are capable of causing salmonellosis in humans; however, only a small number of these serotypes have been associated with foodborne illness. For example, *S. typhimurium* and *S. enteritidis* have been implicated in most of foodborne outbreaks. Symptoms appear between 8-42 hours after ingestion of *Salmonella*-contaminated food. Symptoms include diarrhea, vomiting, chills, fever, nausea, abdominal cramps, and prostration.

In order to detect low levels of *Salmonella* in foods, a series of sequential pre-enrichment culturing steps are needed. The methods include pre-enrichment on selective or differential media for 16 to 24 hours to increase the levels of *Salmonella* organisms.

Cell Biolabs’ Rapid Qualitative *Salmonella* Test Kit provides a quick method for detection of *Salmonella* in food samples prepared in enriched media. This test is designed as an aid in the detection of *Salmonella* and should be used as an adjunct to culture.

**Assay Principle**

The Rapid Qualitative *Salmonella* Test Kit is designed to detect *Salmonella* antigens in contaminated food samples. The test is a rapid qualitative test that is based on the use of *Salmonella*-specific antibodies. The reaction between the enriched positive sample and the colored particle-conjugated antibody will form a complex that migrates along the membrane. An immobilized capture antibody will form a colored line at the test area upon reacting with the colored complex. An internal control line is built in to assure that the test has been carried out correctly. Test results appear in the center section of the test strip (see Figure 1).

**Related Products**

1. AKR-301: Rapid Qualitative *E. coli* O157:H7 Test Kit

**Kit Components**

1. *Salmonella* Test Strips (Part No. 230201): One tube containing 20 test strips
2. Sample Diluent Buffer (Part No. 230202): One 10 mL bottle

**Materials Not Supplied**

1. Enrichment media (Selenite Cysteine Broth recommended)
2. Microcentrifuge tubes

**Storage**

Store kit components at room temperature until their expiration dates.
Preparation of Samples

- This kit is designed for use with food samples. Food samples that will not be tested within 48 hours of collection should be stored at 4°C. Allow refrigerated samples to reach room temperature before testing.
- Samples suspected to contain very high concentrations of Salmonella may be serially diluted in distilled H₂O prior to running the assay. High concentrations of Salmonella antigens may result in a weak or faint control line which may call into question the accuracy of the test.
- Samples containing large amounts of food matter may migrate slowly up the test strip. It is important to add the right ratio of media according to step 1 of the Assay Protocol. Do not allow incubation with the test strip for more than 20 minutes.

Assay Protocol

1. Dilute test sample 1:10 in enrichment media such as Selenite Cysteine Broth. For solid food samples, add 1 g sample to every 9 mL of media. For liquid samples, add 1 mL sample to every 9 mL of media. Incubate the sample/enrichment media at 37°C for 16-24 hrs.
2. Aliquot 100 µL of Sample Diluent Buffer into a microcentrifuge tube.
3. Add 100 µL of the enriched sample (step 1) to the Sample Diluent Buffer. Mix well.
4. Insert the test strip ensuring the arrows point down. Incubate for 20-25 minutes. For a test to be considered valid, a colored line must appear in the control-line section of the strip (Figure 1). If no line appears in the control section, add an additional 50 µL of diluted sample to the tube and insert the test strip back into the tube. Incubate for an additional 4 minutes. Read results no later than 30 minutes after insertion of the test strip.

Interpretation of Results

The test is negative if only one colored line appears in the control section. If even a faint color appears in the test area of the strip, the test should be considered positive. It is not important whether the test line is darker or lighter than the control line.

Figure 1. Illustration of Positive and Negative Test Results with the Rapid Qualitative Salmonella Detection Kit.
